

Kepler Renewable Energy Project

The Kepler project will deploy rooftop solar panels across three municipal buildings.

The planned capacity is 2.4 megawatts, with construction scheduled to begin in October 2026.

The project budget is 4.8 million US dollars and includes a ten percent contingency reserve.

Primary risks are permit delays, supply-chain disruption, and unexpected roof reinforcement costs.

The mitigation plan includes early permit submission, two approved panel suppliers, and structural surveys.

The expected annual carbon reduction is 1,900 metric tons after the system becomes operational.

Project leadership will publish quarterly progress reports to the municipal sustainability committee.
